Hi!

I have made my experiments on VPS-server.

I know how to complete migration from a HN supporting OpenVZ to another.

What I would like to know is if there is a way to migrate a VPS (every applications installed inside) from the OpenVZ HN to another computer running without OpenVZ.

I don't want to execute live migration or anything like this, but only copy the installed applications from the HN to another computer running debian generic kernel. Just a way to avoid downloading and installing everything in the other computer.

How are the VPS saved and stored during migration? I mean, maybe it is possible to copy the content of /vz/root/CTID to my computer to / of the other one? But I don't know how to proceed and I don't want to do anything armfull for the other one :-S

Thank you a lot for your answers and advices!
