
Subject: equal resources on all my vps'es

One of my friends have set up openvz on a server, so that i can use one server in stead of 4 servers.

The hardware node has 4GB of ram. I want to give each vps (4 vps'es on the system, will never be more) 512MB of ram, and the 2GB is for the hardware node and the burstable ram.

How do I have to set this up when the ID's of my vps'es are 156-157-158-159?

Second question : the hardware node has 2x500GB in raid one harddisks. How can i ensure each vps with 100GB of harddisk space? (and 100 for the hardware node)

Thanks for any answer!
