Hi,

We capture periodically the file '/proc/vz/vestat' to obtain the CPU consumption. However, during a snapshot, the counter representing the CPU state 'idle' is decremented (from 13415802950067 to 13414572856874, thus a difference of -1230093193)...

Is this the consequence of a kind of automatic reset of the counter?

Thanks,
Fred
