Thank your for your really quick answer!

This is what i've done so far:

VPS 156 : 100GB diskspace (125GB burst)
vzctl set 156 --diskspace 100G:125G --save
VPS 157 : 100GB diskspace (125GB burst)
vzctl set 157 --diskspace 100G:125G --save
VPS 158 : 100GB diskspace (125GB burst)
vzctl set 158 --diskspace 100G:125G --save
VPS 156 : 25GB diskspace (50GB burst)
vzctl set 157 --diskspace 25G:50G --save

VPS 156 : 512MB ram
vzctl set 156 --kmemsize 512k --save
VPS 157 : 512MB ram
vzctl set 157 --kmemsize 512k --save
VPS 158 : 512MB ram
vzctl set 158 --kmemsize 512k --save
VPS 159 : 256MB ram
vzctl set 159 --kmemsize 256k --save

So now VPS 156-157-158 should have 100GB diskspace and 512MB ram (with 125GB diskspace if bursted). But i didn't find which command i have to use for the 1GB bursted ram. Could you please explain that for me?
