Quote:so you're saying you depend upon the application (Samba, Apache, MySQL, PostgreSQL, NFS, etc.) to handle the brief hang without killing the connection? I know Samba and NFS can deal with this and I suppose the rest are OK...

This is actually a TCP feature. Default (and recommended by an RFC) TCP timeout is about two minutes if I remember correctly. So if the application is using TCP, it will be fine. Surely we tested that with Apache, MySQL, Oracle and other apps.
