Yes, why is there a problem with the fact of setting the VPS IP-address as aliases in the host? In this way, the host could send the packets to the appropriate VPS via a reverse proxy (Apache provides something like this).

But with this way, the VPS has in fact a private address and a translation has to be made by the HN;

Maybe the best way should be to set up a bridge, but I have not read enough to know how to do it (I only do NAT or port forwarding) I am still interested by this discussion!

Thanks!
