We're in the process of building an OpenVZ control panel, however would like a little input.

Its designed to be run with a 'master' script that calls to the 'slaves', each running HyperVM -- ideally we want the scripts on the slave to be as small as possible.

I've looked at all the bandwidth/traffic accounting options on the forum, and wiki however there seems to be very little info on implementation, and which methods are best for an operation such as ours.

Anyone got any idea what would be best here? We need to be able to track monthly bandwidth usage, and possibly display bandwidth graphs.

Thanks for your time.
