Nope, I'm still unable to mount a partition by bind mount without the openvz quota / space usage to go nuts.

I was able to "semi-fix" it, by mounting the partition from the HN inside the VE via NFS; but when the VE hangs by anything, you have to restart the full HN, because if you stop the VE, the hole HN hangs because of something strange on the portmap/nfs kernel usage of openvz. It's not really usefull, but.. it works by now.
