Hello,

I got strange problem. I cannot live migrate one vps to another server. I cannot even vzdump it on the existing server.

Rsync copies data much above user quota. User has 36GB and Rsync goes to 46GB and does not stop!

I tried to do strace of this process and here is info it continues all the time probably at the point when it fullfill all disk space

```
select(1, [0], [], NULL, {60, 0})
                           = 1 (in [0], left {60, 0})
read(0, "\374\17\0\7", 4)
                          = 4
select(1, [0], [], NULL, {60, 0})
                          = 1 (in [0], left {60, 0})
select(1, [0], [], NULL, {60, 0})
                           = 1 (in [0], left {60, 0})
read(0, "\374\17\0\7", 4)
                          = 4
select(1, [0], [], NULL, {60, 0})
                           = 1 (in [0], left {60, 0})
select(1, [0], [], NULL, {60, 0})
                           = 1 (in [0], left {60, 0})
read(0, "\374\17\0\7", 4)
                          = 4
select(1, [0], [], NULL, {60, 0})
                          = 1 (in [0], left {60, 0})
```

How to fix it? How to migrate this vps?
