I'm considering upgrading one or more of our production servers to a newer kernel to try to combat some IO issues we are having with a backup process on the HN depriving the VEs of resources. We're currently CentOS 5.2 on the host nodes with the latest ovzkernel-2.6.18 variant and have not been able to fix the issue.

I am wondering if anyone on these forums is using the 2.6.27 or 2.6.26 ovzkernel on a heavily loaded server and if so, what your experiences have been.

sean
