Subject: Tcpsndbuff size ?
Posted by pug123 on Mon, 29 Jun 2009 12:57:55 GMT

Hello Guys!

Please tell me from your own practise. What is the best way to set proper values of: tcpsndbuf ?
We are trying to write some panel for openvz as HyperVM replacement and don't know how to
figure out these values.

Do you have any good examples? Let's say for vps which
has 1GB guaranteed ram. Manual don't get much clue what values are good/safe? Should it be
100MB 200MB? More or less?

Thank you for any hints.
