Hi,

as far as I understand this situation you'd better use veth inside VE because venet driver drops all network packets that don't contain VEs ip address as a source or destination address i.e. suppose a network packets is coming to VE from the HN through venet0 interface then its destination address must be equal to the ip address that is on venet0 interface inside VE and if a network packet is coming from inside the VE its source address must be equal to that is on venet0 interface inside VE. This was done deliberately so please have a try a veth interface.
