Hi,

I'm trying to install Openvz with debian lenny on my old 32 Bit Machine.

I've made it like this:

Quote:

Quote:

```
apt-get install linux-image-openvz-686 vzctl vzquota
```

then

Quote:

```
ln -s /var/lib/vz /vz
```

then

Quote:

```
apt-get install cstream
```

then

Quote:

```
wget http://www.proxmox.com/cms_proxmox/cms/upload/vzdump/vzdump_1.1-1_all.deb
```

then

Quote:

```
dpkg -i vzdump_1.1-1_all.deb
```

And if I now try to start in the OpenVZ Kernel I've got this error:

Quote:

This kernel requires the following features not present on the CPU:

pae

Unable to boot - please use a kernel appropriate for your CPU

Now what shall I do?

Best regards, Aless
