
Subject: Containers Pause/Freezes for a Second or Two

We are running an older version on Debian 2.6.18 with an Intel X3210 Quad Xeon and it has been great for a couple of years. vzctl version 3.0.11

We have 4Gb, 50 containers, very light usage (CPU usage rarely spikes above 10%).

But we are observing that occasionally a container will pause for a second or two. Since our containers are processing RTP (i.e. VoIP) streams, this results in unacceptable gaps in audio.

Where should we be looking?

CPU usage is modest

memory usage is modest (less than 2Gb total)

user_beancounters does not show any limits being exceeded

What could be causing containers to run fine for minutes and then pause for a second or two?
