---

I added a new block of ips and add them  
as follow one file per IP . rebooted the server  
ifcfg-eth0:5

```
DEVICE=eth0:5  
BOOTPROTO=static  
IPADDR=xxx.xxx.xxx.xxx  
NETMASK=255.255.255.255  
ONBOOT=yes
```

ok i can create containers in openvz and assign ips but i cant ssh to the vps .if i use the ip assigned to the vps to ssh it wont allow access using root and password duo for the vps but on that same ip if i use the root and password duo for the master node i get access to the main node . either using the main ip or any other ip i have in the pool. the only way to ssh to the vps is using the vzctl enter VPS\_ID command.

i need assistance please help!!
