PLEASE NOTE: I am asking here since OpenVZ is equivalent to Virtuozzo and since Parallels support is a complete rip-off (price), and very slow.

How do I apply a MAC Address (of my choice, not random) to a VE (Virtuozzo powered)

I tried this:

```
[root@node root]# vzctl set VEID# --mac "actual mac address here" --save Invalid usage. Option --ifname not specified
```

In order to license software for use for my client's company, the vendor needs the MAC Addresses setup for their vps' virtual enet interfaces.

Tried various methods, not working.

```
[root@node root]# vzctl set VEID# --mac --venet "mac-address" --save Bad parameter for --mac: --venet
```

```
[root@node root]# vzctl set VEID# --mac --eth0 "mac-address" --save Bad parameter for --mac: --eth0
```

```
[root@node root]# vzctl set VEID# --venet --mac "mac-address" --save VEID#: unrecognized option '--venet'
```

```
[root@node root]# vzctl set VEID# --mac "mac-address" --save Invalid usage. Option --ifname not specified
```

```
[root@node root]# vzctl set VEID# --mac "mac-address" --venet --save VEID#: unrecognized option '--venet'
```

Edit/Delete Message

The Virtuozzo NODE uses Centos, as does the VPS container.

Tried this also:

```
[root@node etc]# vzctl set VEID# --netif --mac "mac-address" --save VEID#: option '--netif' is ambiguous
```

```
[root@node etc]# vzctl set VEID# --mac --netif "mac-address" --save
```

Bad parameter for --mac: --netif

```
[root@node etc]# vzctl set VEID# --netif "mac-address" --save  
VEID#: option `--netif' is ambiguous
```
