Hi Dave,

what does it mean "to calculate kmemsize"?

Do you want to calculate kmemsize before VE is created?

If you need to construct a function which calculates kmemsize you have to define what arguments your function takes.

Some consistency checks might be found here:

[http://wiki.openvz.org/UBC\\_consistency\\_check](http://wiki.openvz.org/UBC_consistency_check)

Don't you want to create an experimental kmemsize value i.e. at first make kmemsize (and other user\_beancounters parameters) be unlimited then run inside VE whatever you want and then look at the usage of kmemsize (and other user\_beaucounters parameters) and adjust all properly.
