There is no contradiction - it's more likely my understanding is wrong.

> 16,384,00 >= $YOUR_KMEMSIZE >= $FORMULA_VALUE

I currently get the value, 16,384,000 from the example page but have no idea how this number comes about. How do I get $YOUR_KMEMSIZE or $FORMULA_VALUE (I realise these are example variables)?

Or is it perhaps that I need to create a container then that GIVES me the value of kmemsize so kmemsize isn't calculated at all but is dependent on all the other variables of the system?

If so which variables combine to give kmemsize?
