For example, if I use figures from the OpenVZ example:

avnumproc = 200
datacachesize = 4,194,304

Using the consistency check formula:

$kmemsize \geq 40960 * avnumproc + datacachesize$

Gives us: 12,386,304 not 16,384,000, as listed in the example.

I'm short 3,997,696 bytes.
