---

I wanted to experiment with NFS, but was a little concerned about network "hiccups", in using NFS, since most of my servers are database servers, with replication.

NAS seems to be a good idea, but if you use multiple servers, what about "writes" to the booted image from other servers?

Would a program, such as "MAP:FS", be required, to keep track of the writes, to eliminate duplicate "writes"?

Just a thought.

Cheers
