---

i running keep alived on openvz container

i loaded in the host machine running openvz server the modules:

```
ip_vs
ip_vs_dh
ip_vs_lblcr
ip_vs_nq
ip_vs_sed
ip_vs_wlc
ip_vs_ftp
ip_vs_lblc
ip_vs_lc
ip_vs_rr
ip_vs_sh
ip_vs_wrr
```

if i do a lsmod i show all modules in the host machine

but when i try to run ipvsadm inside the container it returns the same:

```
KeepAlivedExterno02/lib/modules ipvsadm
FATAL Could not load /lib/modules/2.6.24-7-pve/modules.dep No such file or directory
Can t initialize ipvs Permission denied you must be root
Are you sure that IP Virtual Server is built in the kernel or as module
```

sorry but i speak only a little english

thanks
