I'm going to re-post this, as I'm having trouble getting it submitted.

To answer your question, as its stated, add this rule to the INPUT chain.

```
iptables -A INPUT -p TCP -i eth0 -s 0/0 --destination-port \  
22 -j okay
```

There is a firewall script over in the OpenVZ WIKI, you might want to inspect.

http://wiki.openvz.org/Setting_up_an_iptables_firewall

For simplicity in console based firewalls, use SHOREWALL.

Cheers
