I'm going to re-post this,as I'm having trouble getting it submitted.

To answer your question,as its stated,add this rule to the IMPUT chain.

iptables -A INPUT -p TCP -i eth0 -s 0/0 --destination-port \
22 -j okay

There is a firewall script over in the OpenVZ WIKI,you might want to inspect.

http://wiki.openvz.org/Setting_up_an_iptables_firewall

For simplicity in console based firewalls,use SHOREWALL.

Cheers
