Hello OpenVZ Community.

I am currently having a problem with one of the VPSes on my system. Whenever I try starting the VPS, it gives me a certain error that I have listed below.

```
[root@flux ~]# vzctl restart 101
Restarting container
Stopping container ...
Container was stopped
Container is unmounted
Starting container ...
Container is mounted
Adding IP address(es): 76.73.85.107
bash: line 468: 11371 Segmentation fault   cp -f ${CFGFILE} ${CFGFILE}.bak
Setting CPU limit: 200
Setting CPU units: 1000
Setting CPUs: 2
Configure meminfo: 131072
Set hostname: s1.snat.co.uk
ERROR: Can't copy file /etc/hosts
bash: line 304: 11388 Segmentation fault   ${CP} ${cfg} ${cfg}.$$
Container start in progress...
```

None of the other VPSes does this. When I run `vzlist`, it clearly shows that the VPS is working (as shown below)

```
[root@flux ~]# vzlist
  CTID   NPROC STATUS IP_ADDR   HOSTNAME
  101    11 running 76.73.85.107 s1.snat.co.uk
```

However, when I try SSH into the IP address or try access it with the IP address, nothing works. I am very sorry if I haven't given enough information as I ain't very good with OpenVZ however I am learning fast

My kernal details is listed below (well, I think so anyway).

```
[root@flux ~]# uname -a
Linux flux.xxxxxxxxx 2.6.18-128.1.1.el5.028stab062.3 #1 SMP Sun May 10 18:54:51 MSD 2009
x86_64 x86_64 x86_64 GNU/Linux
```

I am sorry if I broken some rules, but I am new to this. I thank you in advance for helping me
