Thank you. I did not know this. Also, I can't reproduce this behaviour. All my br-* interfaces have exactly the same MAC as their eth-interfaces - none of them takes the MAC from a veth*-Interface.

```
# brctl show
bridge name     bridge id            STP enabled    interfaces
br-lan       8000.000e0ca1b929      no           eth0.2
                                    tap0
                                    veth200.0
                                    veth201.0
                                    veth202.0
br-stfg      8000.000e0ca1b929      no           eth0.4
                                    veth400.0
br-wan        8000.000e0ca1b929      no           eth0.3
                                    veth300.0
                                    veth301.0
                                    veth302.0
```

So normally, the MAC can't change when removing/adding veth*-interfaces.

Regards,
divB
