Sorry, but I have some questions to that.

What happens if I assign (f.ex.) /dev/sdb12 with 4GB swap space to a VE (vzctl --devnodes) and type swapon /dev/sdb12 inside the VE?
It is useless? Does it work like I hope? Is there a workaround?

Or would it be better to give 20GB swap space (5 VEs, each one should have 4GB swap) to the host system and no swap to the VE?

Thanks.
