Hi Maratrus,

thanks for your answer. I'm working at the same place, where we have that problem. I would really like to contribute by reporting the issue, but we don't know how to do it correctly. We couldn't find a reliable way to deliberately trigger the kernel messages. Also they sometimes appear without any user interaction. The only what we're left with is those kernel messages.

Would it be sufficient for a reasonable bug report to give the specs of the machine (kernel version, distro/version, arch etc) and the kernel messages we posted here?

Thanks in advance

[edit]

I forgot to mention, that we haven't experienced the problem, since we moved the VEs out of the NFS share to a local partition. Probably I'm wrong, but it seems as the problem was related to the VEs being on a NFS export.
