What is the "right" way to assign 2 different /24's on a host node so that you can divvy up the IP addresses over multiple containers?

For example, let's say I want to do this on centos:

208.192.x.1/24

----- eth ---- CentOS OpenVZ Node ---- container 1 208.192.x.2

208.192.y.1/24 -- ----| ---- container 2 208.192.y.2

Thanks,
CJ
