Hi Niki,

the max value of the ubc (=user beancounters) can set to max value depends on arch:

i386 max value : 2147483647 (unlimited)
X86_64 max value : 9223372036854775807 (unlimited)

-> change the max value (=limit) to the max value of your ct 400 settings via vzctl and please check the info about the user beancounters http://wiki.openvz.org/UBC_secondary_parameters

Btw why are the ubc set to the max limit, any failcounters hit ?

Bye,
Thorsten
