Quote:

What I still do not understand, is why all stale entries in the node's mtab disappear, when I manually unmount the drive while the VE is down. Can anyone imagine, what's the difference in the unmount script context and a root shell with the VE stopped?

Do you want to say that in both cases the mount point actually is not mounted but "umount" command on the HN clears all entries in /etc/mtab in spite of being failed?
