
Subject: *SOLVED* stab77 Kernel Issues

Posted by [mavenman](#) on Tue, 13 Jun 2006 03:00:23 GMT

Okay, last night I installed (or thought so) the latest openvz stable kernel. All looked good, but the grub.conf file was not updated. rpm shows as installed in /var/log/rpmpkgs

First I tried to see if the kernel was installed:

```
#rpm -q ovzkernel-2.6.8-022stab077.1.i686.rpm
```

package ovzkernel-2.6.8-022stab077.1.i686.rpm is not installed

Since it shows rpm not installed, I tried to reinstall it:

```
#rpm -ivh ovzkernel-2.6.8-022stab077.1.i686.rpm
```

warning: ovzkernel-2.6.8-022stab077.1.i686.rpm: V3 DSA signature: NOKEY, key ID a7a1d4b6

```
Preparing... ##### [100%]
```

```
package ovzkernel-2.6.8-022stab077.1 is already installed
```

Here is a return showing the pieces of the install that were copied on the initial install:

```
# find / -name '*stab077*' -print
```

```
/boot/initrd-2.6.8-022stab077.1.img
```

```
/boot/System.map-2.6.8-022stab077.1
```

```
/boot/vmlinux-2.6.8-022stab077.1
```

```
/boot/vmlinuz-2.6.8-022stab077.1
```

```
/usr/local/src/ovzkernel-2.6.8-022stab077.1.i686.rpm
```

```
/lib/modules/2.6.8-022stab077.1
```

Current Kernel is vmlinuz-2.6.9-34.ELsmp, CentOS 4.3

Any advice on how to proceed?
