Hi everyone, I am rahter new here.

For the past 2 years we have been hosting one of our Joomla sites on a VPS server. It also has a wordpress blog installed. There is only one site on the VPS and it was working fine until just 3- 4 moths ago.

The site kept on crashing or just not working. I always had to submit a ticket to get support techs to add a little more resource to our VPS because they say it was hitting its limits. I am not to technical with SSH so I am afraid I do not know much but upon checking the beancounters they sent me this:

resource held maxheld barrier limit failcnt
kmemsize 5192631 5210148 30316150 30316160 9061732
privvmpages 110459 114316 139934 139954 907
numfile 2948 2938 5000 5000 30839
numiptent 10 10 2000 2000 10667

The site gets about unique 500 visits a day based on Google analytics so I do not understand why we are hitting these limits? Does anyone have an experience in this or could point me in the right direction on what i should be checking and why the site is hitting these limits. We add about 3 articles a week to the site but nothing fancy?

Our hosting company recommends us upgrading to a dedicated server but for one site only?

I appreciate your help.
Thanks,
E.M.
