Hi !

ISPconfig is a control pannel to administrate a shared hosting solution, it will administrate services like Apache, ProFTPd, MySQL and Bind. But ISPconfig isn't a control pannel to administrate OpenVZ.

So, you can install ISPconfig inside an OpenVZ container without problem just follow these guides :

- For Debian Etch + ISPConfig 2: http://www.howtoforge.com/perfect_setup_debian_etch

- For Debian Lenny + ISPConfig 3:
http://www.howtoforge.com/perfect-server-debian-lenny-ispcon fig3

For ISPConfig 3 pay attention to the README, beacause there are a note about the installation in a OpenVZ container !

Almost all the issues you might encounter installing OpenVZ IPSConfig in a container found in bean_counters

If you are looking for a control panel for OpenVZ, the "unique" or the "better" is WebVZ:
http://webvz.sourceforge.net/
