Subject: Re: VEs in more than one subnet/with more than one NIC
Posted by bithead2 on Thu, 17 Sep 2009 20:24:08 GMT

I have posted similar questions before and never got an answer so I would like to hear about how to do this.

I think if I knew what the general procedure involved to give a container 2 different IPs in 2 different subnets I'd be happy.

For example, let's say you have a host computer with 2 ethernets, one in the 192.168.2.0/24 network and one in the 10.3.2.0/24 network. Let's say that 192.168.2.0 is the "upstream" network and you are using 10.3.2.0 as the network that talks to private machines not on the internet.

What would be involved in putting the IP of 192.168.2.4 as well as 10.3.2.4 on the container, with 192.168.2.1 as your default gateway?
