
Subject: Add additional eth1 interface to CT for sniffing traffic

Hi,

I'm running CentOS on a server with 3 physical network cards. The first card eth0 is used for CT0 and all CT's for general network access.

I want to configure the second card eth1 to be used by one CT for sniffing traffic using something like tcpdump. I can't figure out how to do this? Preferably since it's only used for sniffing, I don't want to give this second interface an IP address and this interface won't be used by any other host.

Can someone point me in the right direction please?

Thanks,
Marc
