So basicly backup and reload from new to old will work as well ?

Regarding kernel 2.6.24 , i found it well suited to our need in a test small server for now seems we test KVM and openvz on the same host .

Im not sure stable in your opinion is our stable

the HOST is havy loaded but not havy havy loaded (just few VE's)

will this version(2.6.24) will work fine as in no crashes etc..

version 2.6.18 doesnt include KVM moudle build in(only sees 2.6.20) and compiling a new kernel with openvz and kvm is a bit out of the loop right now .

Thanks ,
