Some command is returning the string "vps-net_add Warning: Device list is empty" and then each word is treated as a network device.

How does your 101.conf and 201.conf files look like?

What does ls /var/lib/vz/private output?

Quote:I manually copied files to the host /var/lib/private/201

Did something go wrong with your copy command. Above command has no vz in path.

It seems you somehow have changed a globally configuration file or setting.
