
Subject: *SOLVED* OpenVZ mount script works incorrectly

MySQL database works on host. I want to share /var/run/mysqld/ directory to guest system.

Here is my 101.mount script

```
#!/bin/bash
```

```
mount --bind -n /var/run/mysqld /home/vz/root/${VEID}/var/run/mysqld
```

When I run

```
vzctl start 101
```

it wipes whole host directory /var/run/mysqld, and mysql went down. So I have no '/var/run/mysqld' and no '/home/vz/root/\${VEID}/var/run/mysqld'.

When I'm trying to mount this directory manually after the guest system was started - everything works fine.

What is wrong?

I'm running Debian Lenny Linux host 2.6.26-2-openvz-686 #1 SMP Wed Aug 19 07:30:34 UTC 2009 i686 GNU/Linux

```
vzctl --version
```

```
vzctl version 3.0.22
```
