in addition - all connections, which are in /proc/net/ip_conntrack
are to CT 300 IP to port 80. And CT 300 is the exact OpenVZ VPS which previously had issues
with orphaned sockets. So, previously it throwed this error:
 Orphaned socket dropped (187,374 in CT300)
For now it throws this:
 ip_conntrack: CT 0: table full, dropping packet.

But still all connections which are in /proc/net/ip_conntrack goes to CT 300 - apache. The main
hardware server (CT 0) does not have apache installed at all.

Regards,
Maksym.
