Subject: Re: kernel panic after ping to domain
Posted by khorenko on Thu, 29 Oct 2009 14:03:26 GMT

Hi again.

Unfortunately screenshot does not help at all in this case: you see, the calltrace we see there is not the first one (there are some lines from previous calltrace), and thus this calltrace is really useless.

Please, try to collect complete log. You've said SMP (that is "non-pae/non-ent" kernel) works fine, this let us hope the problem is not network related and thus network console might also work.

Hope that helps.
