Hi all

Can't judge if OpenVZ is dying, but I think it most likely won't happen. OpenVZ is the basis of Parallels Virtuozzo Containers, a commercial virtulization solution which are used by many hosting companies around the world.

OpenVZ follows what ever kernel Red Hat uses in their commercial products. The kernel version for RH 5 is 2.6.18-164 I think.

Anyway, my attitude about OpenVZ is to accept this fact and avoid development branches. This means I won't be able to use the newest features in the vanilla Linux kernel of course!
