Hi screenie,

I'm running 5 openvz servers. The first one deployed last year is a proxmox. It's still running version 1.1. Then I have a couple of Debian Lenny based 686 and amd64 ones I installed from scratch. I don't think you should mix the two. It's either proxmox with their choice of kernel or debian GNU/Linux lenny with their kernel.

proxmox:~# uname -a
Linux proxmox 2.6.24-2-pve #1 SMP PREEMPT Wed Jan 14 11:32:49 CET 2009 x86_64 GNU/Linux

proxmox:~# cat /proc/mdstat
cat: /proc/mdstat: No such file or directory
proxmox:~# modprobe md
proxmox:~# cat /proc/mdstat
Personalities :
unused devices: <none>
proxmox:~# modprobe raid10 raid0 raid456 raid1
proxmox:~# cat /proc/mdstat
Personalities : [raid10] [raid0] [raid6] [raid5] [raid4] [raid1]
unused devices: <none>

So apt-get install mdadm and figure out how to make proxmox use the software raid you setup.

Debian user since '96...
