privvmpages is allocated (but not always used) memory. Many apps (such as Java) tend to allocate much more than they actually use.

Rules (constraints) of privvmpages allocation for multiple containers are described here:

[http://wiki.openvz.org/UBC_systemwide_configuration#Allocate d_memory](http://wiki.openvz.org/UBC_systemwide_configuration#Allocate_d_memory)

You can use vzmemcheck to see if you are on the safe side.
