Hi Philipp,

cat /proc/user_beancounters:

uid	resource	held	maxheld	barrier	limit	failcnt
	privvmpages	381463	384383	384000	393212	821

Look, you simply got a "privvmpages" failcounters, which means that your Container allocated too much memory and hit its limit (allocated != used).

Well, i think you have to understand what application inside a Container requires so many RAM (381463*4096=1562472448 ~ 1.5 Gb is quite a lot) and decide if this is normal or not for that application.

And if you decide that this is normal, should just have to increase the privvmpages limit.

Hope that helps.

And talking about CPUUNITS... well, just leave it by default at least you get a stable and working system.

Good luck!
