Obviously there is a problem with 2.6.18-164.2.1.el5.028stab066.7, within 48 hours it crashed 3 times
(while 2.6.18-128.2.1.el5.028stab064.8 never give me even one trouble).

I activated KDUMP, such for the last crash generated a vmcore file.
Problem "crash" is not willing to give me any data, as there is no debugging information in the kernel...
I tried to recompile kernel with builddebug and buildkdump set to 1, but crash is still not happy...

Could somebody give me some hint how to extract meaningful data from vmcore and feed the list??
what is the best way to proceed?
Seems to me the two last crash occur at almost the same time
(may be a cron action trigerring fault?).

Many Thanks for your help.
