My crash is random, everything is fine at boot time...
Yes I am using NFS (clients) inside VPS, but crash seems not related.
I wonder if there a real kernel trouble or if new
kernel showing hardware weakness/sensitivity....

My understanding: to analyze vmcore file, you need to
generate kernel with debuginfo RPM...
seems to me, specs file is not providing this for many release now
in 2.6.18-rhel5

Could someone knowledgeable on kernel RPM confirm this??,
is there a way to recompile kernel and generate debuginfo RPM??

Many thanks...
