Hello,

it would be great if you were able to install serial console and get all logs from the crashing system.
http://wiki.openvz.org/Remote_console_setup#Serial_console
Moreover, when the kernel is in panic try to use Alt-Sysrq-*
- p (twice the number of CPUs)
- w (several times)
- t (for all processes' calltraces. Please, note this is a time consuming operation.)

Then file a bug. Describe your situation and provide the gathered logs.
http://bugzilla.openvz.org/

A properly filed bugreport will help you to solve the problem.
