Hi there...

I have my server in a VPS based on Virtuozzo.

Operating system: Redhat Linux 7.3

Kernel and CPU: Linux 2.4.20-020stab009.8.777-smp on i686

Processor information: Intel(R) Xeon(TM) CPU 2.40GHz, 2 cores

Real memory: 3.70 GB total, 2.34 GB used

Virtual memory: 8 GB total, 953.57 MB used

Local disk space: 4.15 GB total, 1.48 GB used

I want to update it, but I don't have access to the HN.

I only have full access by SSH to my container.

I am running Red Hat 7.3 (very old) and I want to update it to CentOS...

Is it posible to run CentOS 5 or any other on top of a Linux 2.4.20 kernel?

Because I think that I can't update the kernel from the client side? is this correct?

Thank for your help ...
