---

Thanks for the info.

"my" crash was not as obvious as described in bug report  
(crash happened "randomly", related to load?).

My main concern was the kernel provided without  
debuginfo capabilities, such we (we as the users) were  
not able to provide meaningful data (just guessing) to  
fix/upgrade openVZ kernel.

I'll try 028stab066.10 quickly and let you know.

Busy working this week-end on "vzgot".. an RPM of mine.

so far I have vzgoot boot|shutdown 'container\_name' working and

I am able to run container within a PLAIN (untouched) 2.6.31.6-162.fc12 kernel.

I am using the exact same fc12 template I am using with openVZ, rc.sysinit and networking are  
working fine too.

(was able to access the container from outside via SSH).

I need to make the link to cgroup and implement something

as vzgot firstboot|migrate (not live) to have a nice little toy to play with.
