Subject: See connections from other VE's in netstat

Hi,

When i run netstat -tapn i can see the connections of ip's from other VE's on the same hardware node.
In the netstat column Local Adress (inside the VE) there are the "neigbour" VE ips beside mine. I think there only should be connections from my VE IP not from the others too.

Is that a feature or a security critical bug.

How can i disable that, or is it neccessary?

Devices in VE's are venet Devices.

Thx.
